The Feedback Loop

Why the riskiest systems are the quiet ones, not the wrong ones.

The most dangerous AI systems
aren't the inaccurate ones.

They're the ones whose mistakes
never make it back to anyone who
could fix them.

A feedback loop: output happens → someone notices if it's wrong → that correction changes future output.

Break any link in that chain and errors compound silently.

Before trusting an AI workflow, ask: when this is wrong, who finds out — and does that finding-out ever reach the system?

**If the answer is 'no one,' that's the
real risk.**
